

Due to high demand: Effective immediately, the new type of shock absorber 632 is delivered!

During the development of the new BMW-WESA-Dynamic-technology a new feedback-adjuster with “blow-off” valve was created. From IMMEDIATELY, and not as announced in September exactly this technology is now being integrated in our shock absorbers type 632 stereo and mono!

The 22-times adjustable feedback enables you to optimally pick comfort as well as reaction behavior at any time! Bigger blows are softly to be filtered and absorbed by the “blow-off” system. Thus more than ever the rider is protected from hard hits.

The valve consists of a new design in high-quality milled aluminum.

The current double-adjustment of compression in high- and low-speed will be taken from our array of products with the availability of the new 632 TS- and mono-shocks right now!

During the running season 2014 the new 632 with the “blow-off” and feedback-adjuster will be available at the same price as the old version!
